

FEEL CONFIDENT IN YOUR *Water Quality*

Potential discoloration may occur from time to time in your water supply. Although the change in color may be concerning in its appearance, the water is safe to consume.

@vcwdwater

The following information describes common causes for possible changes in your water:

**REDDISH/
BROWN WATER**

Minerals, such as iron, accumulate in water mains over time. When the pipes are disrupted, after construction for example, discoloration can occur.

The water is safe.

**CLOUDY/
MILKY WATER**

Tiny air bubbles in the water, similar to gas bubbles in beer and soda.

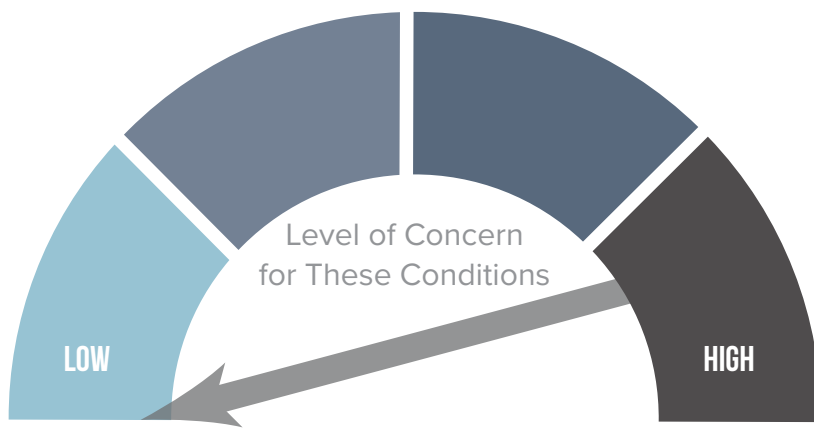

DISCOLORED WATER

Particles and sediment resulting from changes or activities in the water distribution system such as the flushing of water.

**TASTE/SMELL
IN THE WATER**

Chlorine that has been added to the water to kill germs.

WHAT CREATES THESE ISSUES?

Typically, system maintenance (such as flushing of water) creates these issues as a result in changes to the water distribution system. Particles and sediment are a natural occurrence when properly treating and maintaining a safe, and reliable distribution system.

To report a drinking water concern, please contact the District at: (626) 338-7301

YOUR WATER IS SAFE

Routine water samples are collected and taken to a state-certified laboratory for analysis. Valley County Water District meets and exceeds all State and Federal drinking water standards.
